We will install Firebug and FirePath in the next lecture.

Latest version of Firebug is integrated in Firefox and does not support FirePath.

FirePath is very important to build effective XPath.

There are options that allow us to still use FirePath. I have discussed couple of options in this article.

1. Use latest version of FF. I always prefer that because Selenium WebDriver also comes up with new versions and it's good to be updated.

Please use these versions of Firebug and FirePath.

Firebug version 2.0.13 (which is not a latest version) and FirePath 0.9.7.1.1

https://addons.mozilla.org/en-US/firefox/addon/firebug/versions/

2. If above does not work and Firebug version 2.0.13 has issues in installing with the latest version of FF, then install FF 47.0.1 -> I have verified that Firebug and FirePath works with this version.

Please use these versions of Firebug and FirePath.

Firebug version 2.0.13 (which is not a latest version) and FirePath 0.9.7.1.1

https://addons.mozilla.org/en-US/firefox/addon/firebug/versions/

Then update your FF to be on the latest.

This way, you will be able to install Firebug and FirePath and FF will also be updated.

Alternatively, you can try this with the latest FF and latest Firebug:

In address enter about:config, search

browser.tabs.remote.autostart -> Set it false

browser.tabs.remote.autostart.1 -> Set it false

browser.tabs.remote.autostart.2 -> Set it false
